5 Customization 11

vim-autoflake is a Vim plugin that applies autoflake to your current file. autoflake remove unused imports and unused variables as reported by pyflakes.

CHAPTER 1

Required

- autoflake

CHAPTER 2

Installation

Simply put the contents of this repository in your ~/.vim/bundle directory.

CHAPTER 3

Documentaion(Read The Docs)

- https://vim-autoflake.readthedocs.org/en/latest/

CHAPTER 4

Usage

shortcut

1. Open Python file.
2. Press <F9> to run autoflake on it

call function

```
:Autoflake
```

CHAPTER 5

Customization

If you don't want to use the *<F9>* key for autoflake, simply remap it to another key. It autodetects whether it has been remapped and won't register the *<F9>* key if so. For example, to remap it to *<F3>* instead, use:

```
autocmd FileType python map <buffer> <F3> :call Autoflake()<CR>
```

To allow autoflake to remove additional unused imports (other than than those from the standard library), use the autoflake_imports option. It accepts a comma-separated list of names.

```
let g:autoflake_imports="django,requests,urllib3"
```

Remove all unused imports (whether or not they are from the standard library).

```
let g:autoflake_remove_all_unused_imports=1
```

Remove unused variables,

```
let g:autoflake_remove_unused_variables=1
```

Disable show diff window

```
let g:autoflake_disable_show_diff=1
```
